Life history parameters

Life history parameters from Fish Base for the Von Bertalanffy growth model were L_∞ (58.7), k (0.286), and t_0 (-0.416), for the length/weight relationship $W = aL^b$ were a (0.0204) and b (2.93), and age at maturity (a_{50}) was (4.41).

The values for the empirical Gislason natural mortality relationship m_1 and m_2 were (174.5) and (-1.61) respectively.

The fishery was assumed to only catch mature fish and so selection pattern is modelled by a double normal equivalent to the maturity ogive, parameters were a_1, s_l and s_r were (5.41, 1, 5000) respectively.

The stock recruitment relationship is assummed to be of a Beverton and Holt functional form with a steepness and virgin biomass of 0.8 and 1000 units respectively.

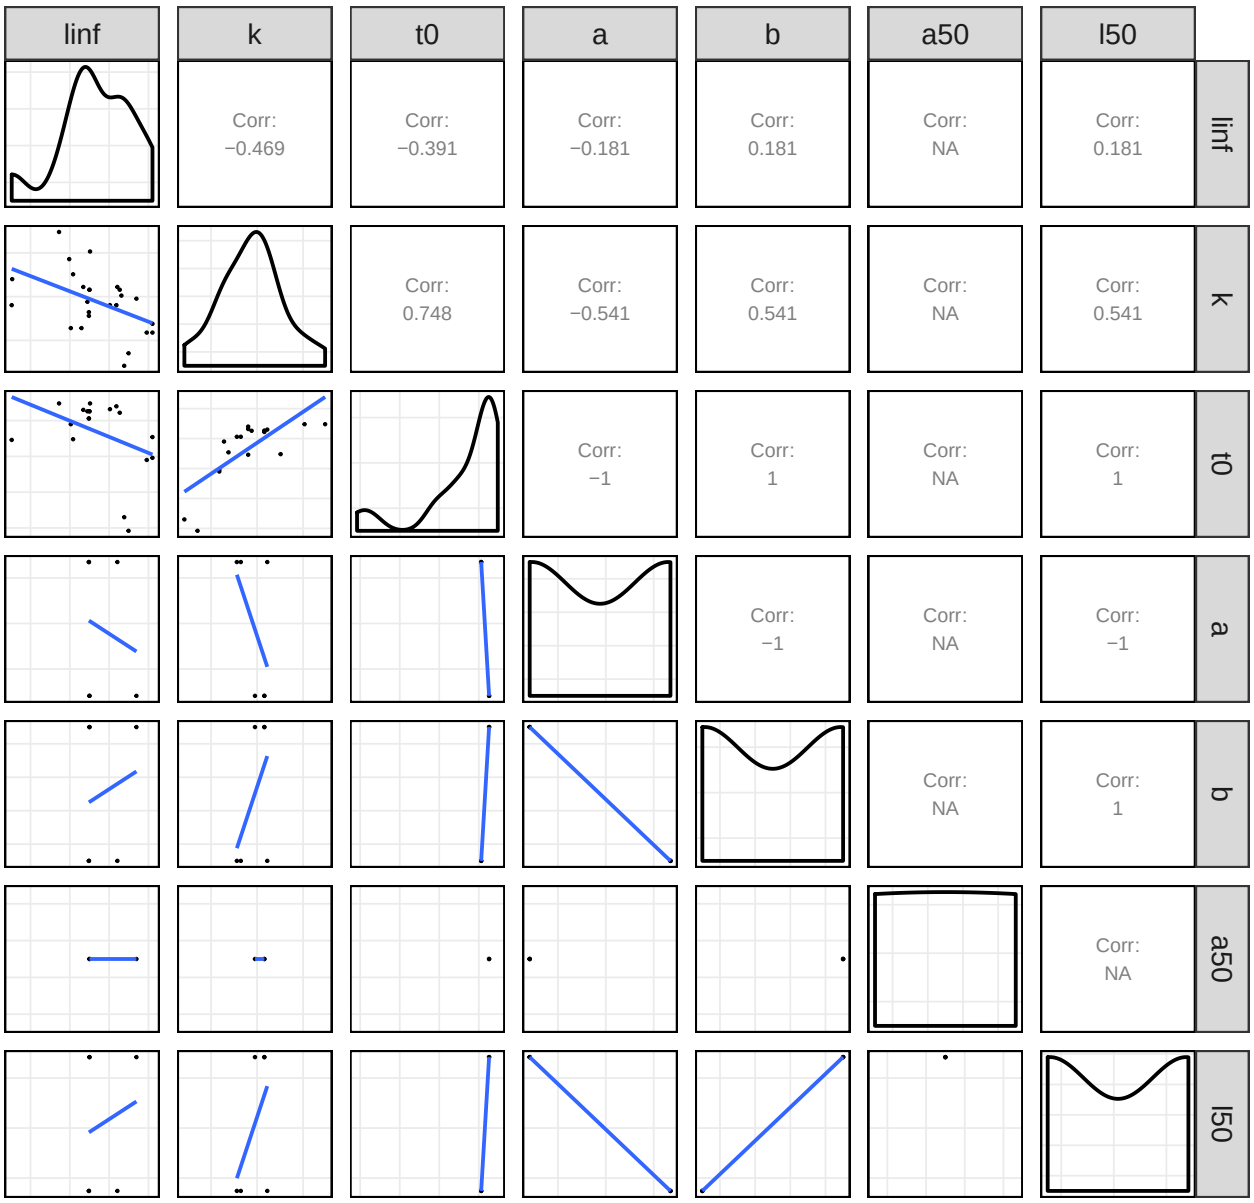

Figure 1 Pairwise scatter plots of life history parameters.

Equilibrium dynamics

The parameters are then used by `lhEql` to simulate the equilibrium dynamics by combining the spawner/yield per recruit relationships with a stock recruiment relationship.

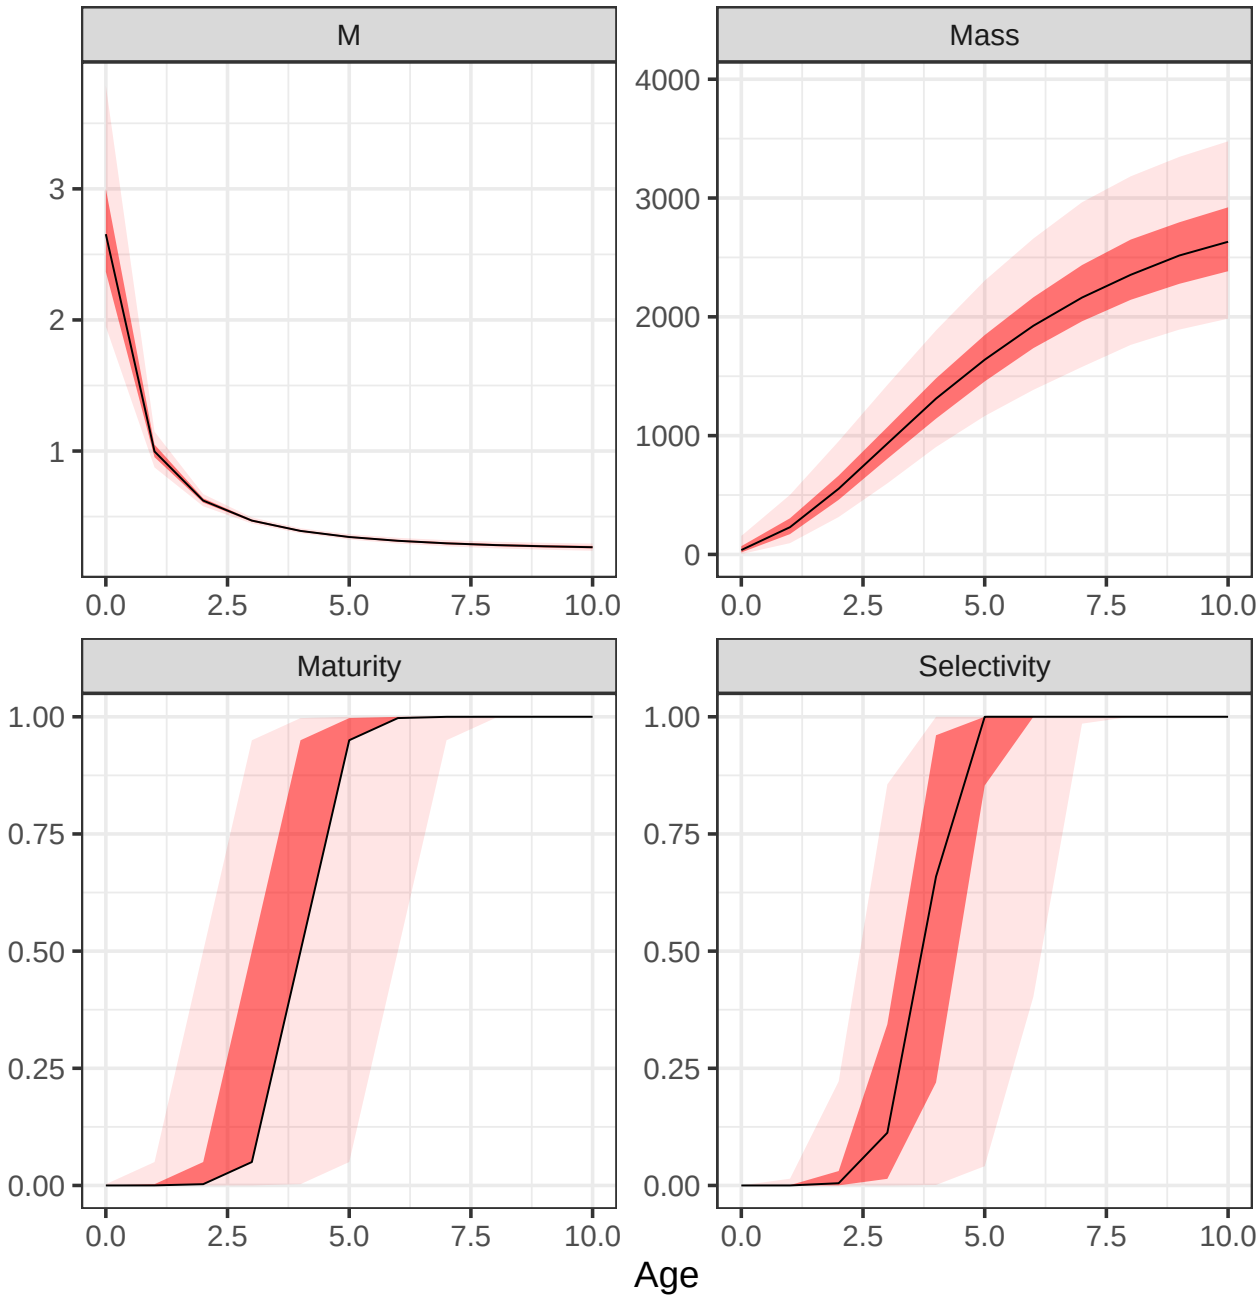

Figure 2 Vectors.

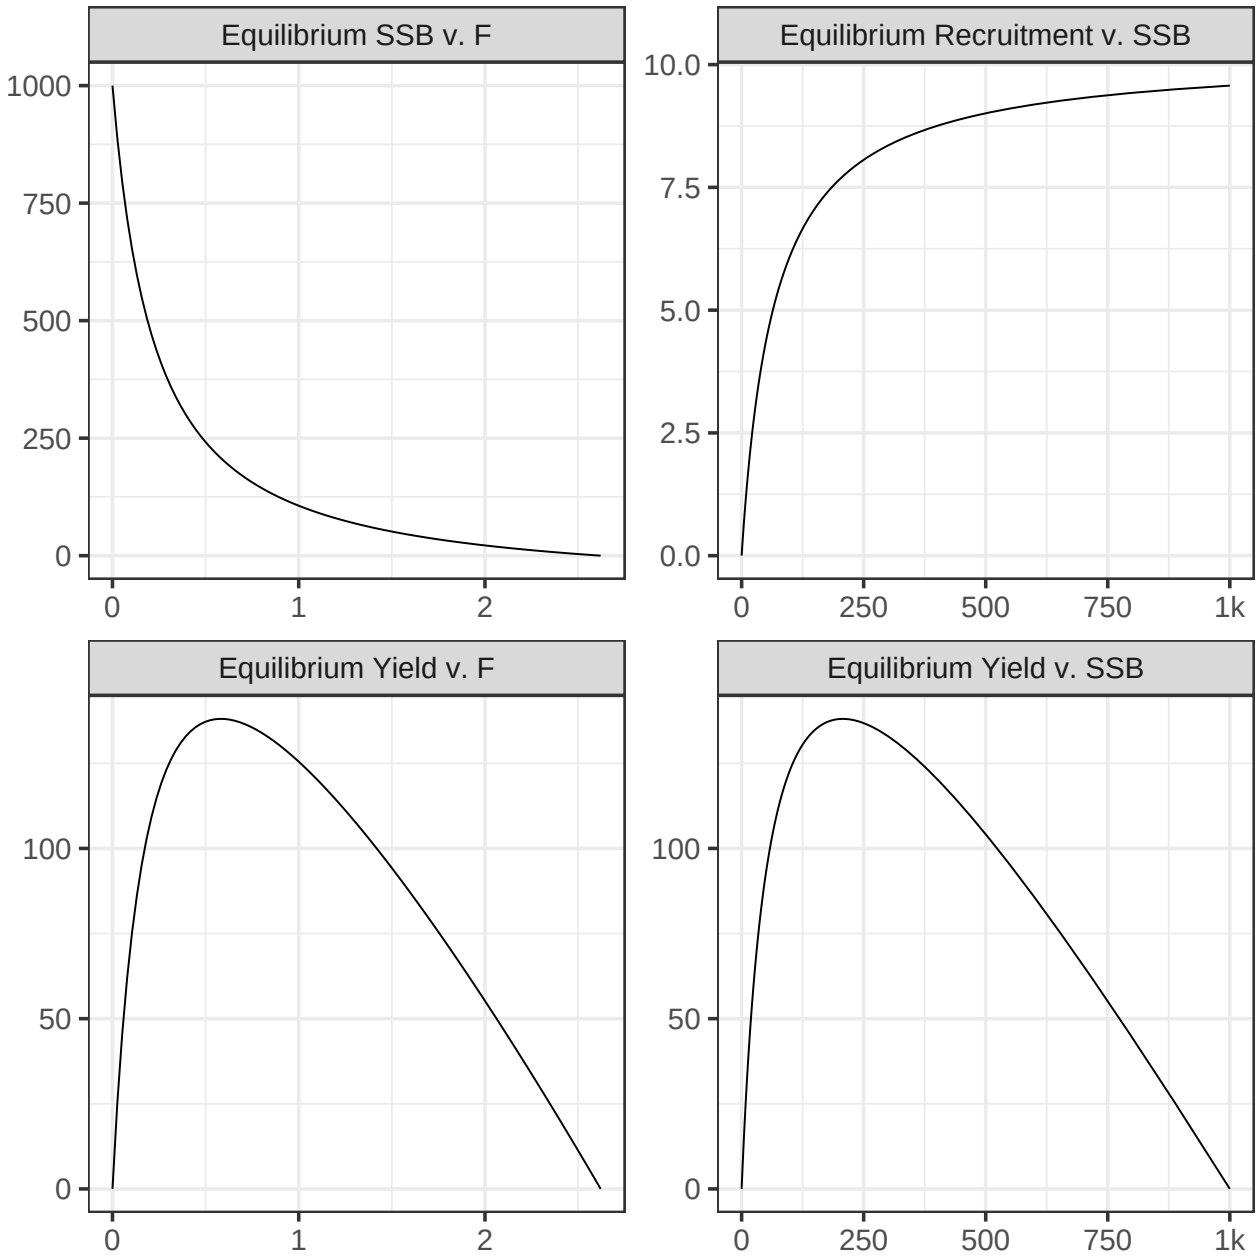

Figure 3 Example equilibrum Curve.

Population dynamics

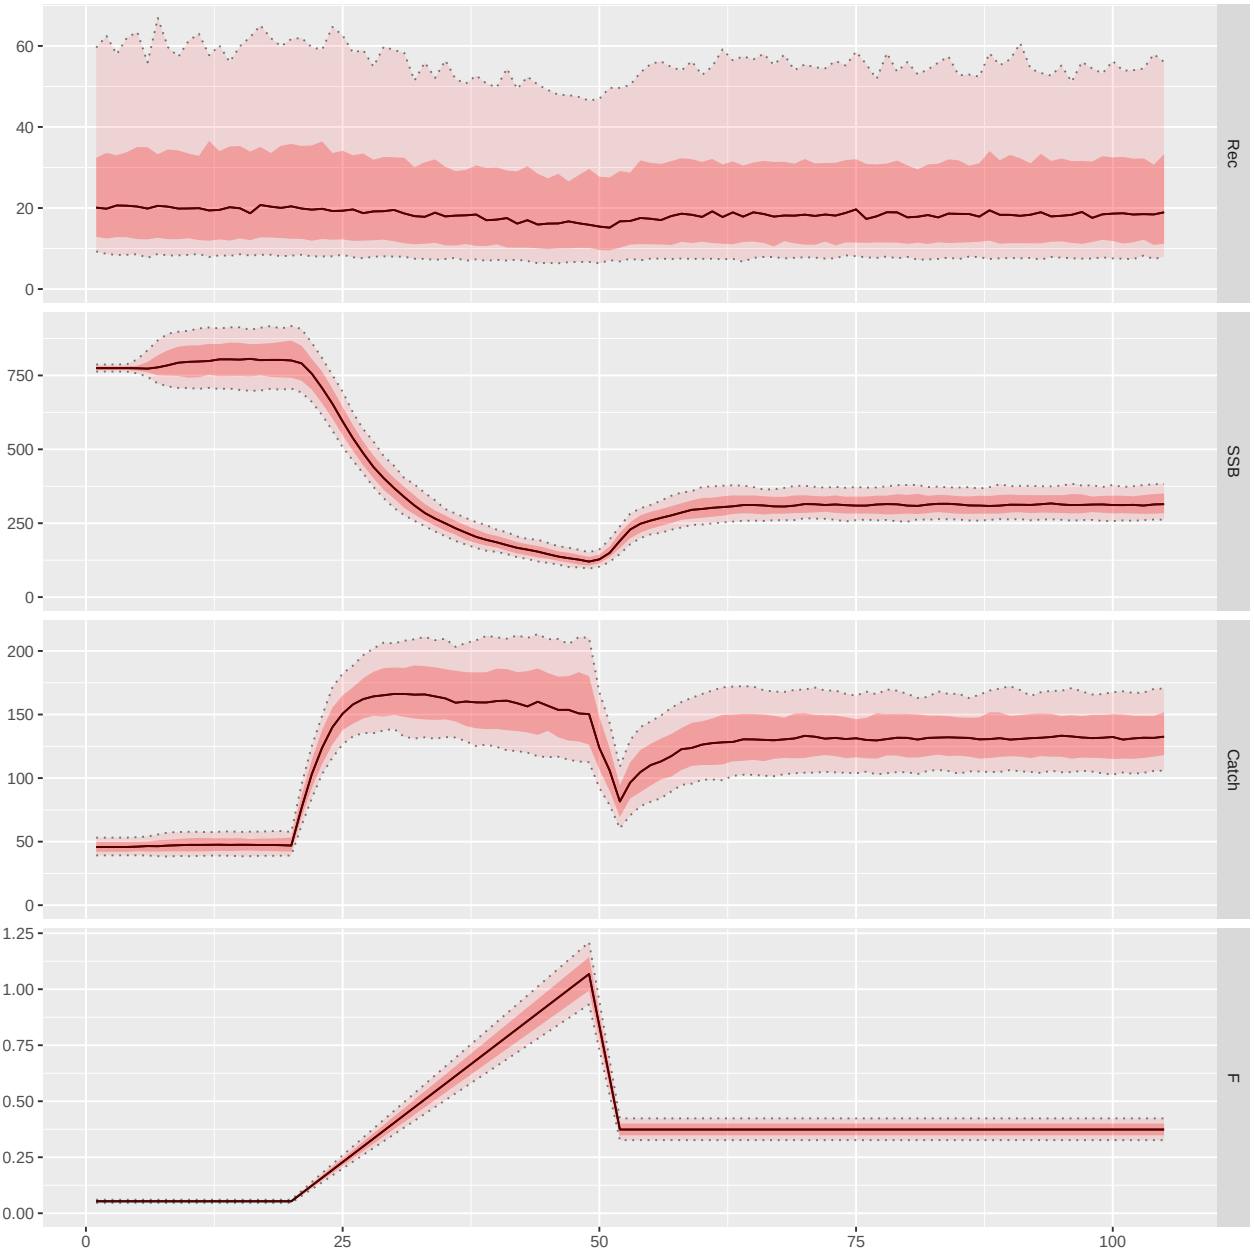

Figure 4 Time series.

Software Versions

- R version 3.4.1 (2017-06-30)
- FLCore: 2.6.8
- FLBRP: 2.5.3
- FLasher: 0.1.0
- FLife: 3.2.0
- ggplotFL: 2.6.4
- **Compiled**: Sun Jul 22 15:53:56 2018

Author information

Acknowledgements

This vignette and many of the methods documented in it were developed under the MyDas project funded by the Irish exchequer and EMFF 2014-2020. The overall aim of MyDas is to develop and test a range of assessment models and methods to establish Maximum Sustainable Yield (MSY) reference points (or proxy MSY reference points) across the spectrum of data-limited stocks.
